

Dermal HA Fillers

Juvéderm, Voluma, Restylane, Restylane Silk, Belotero, Perlane

What to Expect During and After Your Procedure

During your procedure:

- An assessment will be made by your physician to determine type of product and appropriate amount needed.
- Multiple injections will be administered to treated areas
- The filler contains lidocaine, however some physicians may decide to use a topical numbing agent or local anesthesia injections prior to filler injections.
- You may have a very small amount of pinpoint bleeding where the needle was inserted. This usually subsides in a few minutes.

After your procedure:

- You may use your regular skin care products and make-up.
- You can apply ice packs to ease tenderness and swelling.
- Do NOT manipulate, rub, massage, apply pressure, etc. to treated areas or lay face down after treatment.
- Immediately after treatment you will experience swelling which can last 1 – 3 days. The above mentioned fillers are made from hyaluronic acid (which is a substance your body normally produces) and it attracts water to it which causes the swelling.
- You may feel lumps where the filler was injected. This is also swelling and they will subside in about 3 - 5 days and are usually not visible.
- You may get a bruise from the injections. If so, you are welcome to come into the office the following day and have the bruise(s) treated with a laser at no charge.
- You may also take Arnica pills before and/or after the treatment to decrease risk of bruising and to help any bruises you have to subside faster. We have Arnica available for purchase.
- Results are immediate but due to the swelling, the expected end result can be seen between 7 - 10 days.
- Follow any additional specific post treatment instructions from your physician.
- It is always a possibility that you may not get the desired result after one treatment. Additional treatments may be necessary to achieve optimal desired results.

Dermal HA Fillers

- Follow up with your physician in _____ days/weeks, or as needed.
